

Corrective Retrieval Augmented Generation, abbreviated CRAG, uses a lightweight retrieval evaluator to assess the quality of retrieved documents. Depending on confidence, CRAG accepts evidence, filters ambiguous results, or triggers a broader search. A decompose-then-recompose step extracts relevant knowledge.

CRAG applies correction after initial retrieval rather than teaching the generator reflection tokens. The evaluator estimates retrieval confidence, and low-confidence evidence can trigger corrective retrieval. This differs from Self-RAG, which integrates adaptive retrieval and self-critique into generation.
